E = Essential Variables which must be indicated on both the WPS and recorded on the PQR . Any changes to these variables require requalification of WPS

S = Supplementary Essential Variables must be indicated on the WPS and recorded on the PQR when toughness testing is required. Changes to these variables when toughness testing is performed require requalification of WPS.

N = Nonessential variables must be indicated on the WPS but when changed do not require requalification of WPS

NOTE 1: WPS's are to indicate **all** Essential, Nonessential and when required Supplementary Essential variables applicable for the process. PQR's are to indicate **all** Essential and when required Supplementary Essential variables applicable for the process. Do not indicate variables which are not used as NA.

They are applicable and should be entered on the WPS or PQR as "None" / "Not used" or similar.

NOTE 2: Be careful of converting a temperature value and a temperature difference for example:

A preheat or interpass temperature of 200°C: $(9 \times 200^{\circ}\text{C})/5 + 32 = 392^{\circ}\text{F}$ with a permitted decrease of 100°F gives

 $392^{\circ}F - 100^{\circ}F = 292^{\circ}C$ converted back to $^{\circ}C$ ($292^{\circ}F-32$)x5/9 = 144,44 $^{\circ}C$; the difference is $200^{\circ}C - 144,44^{\circ}C = 55,56$. This permits an increase or decrease of **55,56°C** not as would be assumed from converting $100^{\circ}F(100^{\circ}F-32)$ x5/9 = **32,7°C**
